Introduction to String Theories

Gönenç Moğol

2018-10-01

Overview

- Motivation
- Bosonic String
 - Quantisation
 - Closed Spectrum
- Superstring
 - Type IIA/B
 - Type I
 - Heterotic Strings

Why String Theory?

• It is fun

Why String Theory?

- It is fun
- UV-finite
- Provides a theory of quantum gravity
- Creates tools for other areas of physics and mathematics
- Has the right ingredients for producing standard model

• Units and conventions: c=1, $\hbar=1$, $\eta=\mathrm{diag}(-1,+1,\ldots,+1)$

- Units and conventions: c=1, $\hbar=1$, $\eta=\mathrm{diag}(-1,+1,\ldots,+1)$
- Relativistic particle Lagrangian:

$$S = -m \int d\tau$$

- Units and conventions: c=1, $\hbar=1$, $\eta=\mathrm{diag}(-1,+1,\ldots,+1)$
- Relativistic particle Lagrangian:

$$S = -m \int \, \mathbf{d} \boldsymbol{\tau}$$

- Units and conventions: c=1, $\hbar=1$, $\eta=\mathrm{diag}(-1,+1,\ldots,+1)$
- Relativistic particle Lagrangian:

$$S = -\mathbf{m} \int \,\mathrm{d}\tau$$

- Units and conventions: c=1, $\hbar=1$, $\eta=\mathrm{diag}(-1,+1,\ldots,+1)$
- Relativistic particle Lagrangian:

$$S = -m \int d\tau$$

• Generalize to an extended object:

$$S = -T \int d\mathcal{A}$$

- Units and conventions: c=1, $\hbar=1$, $\eta=\mathrm{diag}(-1,+1,\ldots,+1)$
- Relativistic particle Lagrangian:

$$S = -m \int d\tau$$

• Generalize to an extended object:

$$S = -T \int dA$$

- Units and conventions: c=1, $\hbar=1$, $\eta=\mathrm{diag}(-1,+1,\ldots,+1)$
- Relativistic particle Lagrangian:

$$S = -m \int d\tau$$

• Generalize to an extended object:

$$S = -T \int dA$$

Manipulations of equation of motion result in wave equation

- Manipulations of equation of motion result in wave equation
- \bullet Left and right moving weaves $X^{\mu}=1/2\left(X_{L}^{\mu}+X_{R}^{\mu}\right)$

- Manipulations of equation of motion result in wave equation
- Left and right moving weaves $X^{\mu}=1/2\left(X_{L}^{\mu}+X_{R}^{\mu}\right)$
- With Fourier expansions:

$$X_L^{\mu}(\tau + \sigma) = x^{\mu} + \frac{p^{\mu}l^2}{2} \cdot (\tau + \sigma) + il \sum_{n \neq 0} \frac{1}{n} \alpha_n^{\mu} e^{-in(\tau + \sigma)}$$

$$X_R^{\mu}(\tau - \sigma) = x^{\mu} + \frac{p^{\mu}l^2}{2} \cdot (\tau - \sigma) + il \sum_{n \neq 0} \frac{1}{n} \widetilde{\alpha}_n^{\mu} e^{-in(\tau - \sigma)}$$

- Manipulations of equation of motion result in wave equation
- Left and right moving weaves $X^{\mu}=1/2\left(X_{L}^{\mu}+X_{R}^{\mu}\right)$
- With Fourier expansions:

$$X_{L}^{\mu}(\tau + \sigma) = x^{\mu} + \frac{p^{\mu} l^{2}}{2} \cdot (\tau + \sigma) + i l \sum_{n \neq 0} \frac{1}{n} \alpha_{n}^{\mu} e^{-in(\tau + \sigma)}$$

$$X_R^{\mu}(\tau - \sigma) = x^{\mu} + \frac{p^{\mu} l^2}{2} \cdot (\tau - \sigma) + i l \sum_{n \neq 0} \frac{1}{n} \widetilde{\alpha}_n^{\mu} e^{-in(\tau - \sigma)}$$

- Manipulations of equation of motion result in wave equation
- Left and right moving weaves $X^{\mu}=1/2\left(X_{L}^{\mu}+X_{R}^{\mu}\right)$
- With Fourier expansions:

$$X_L^{\mu}(\tau+\sigma) = \mathbf{x}^{\mu} + \frac{\mathbf{p}^{\mu}l^2}{2} \cdot (\tau+\sigma) + il \sum_{n \neq 0} \frac{1}{n} \alpha_n^{\mu} e^{-in(\tau+\sigma)}$$

$$X_R^{\mu}(\tau - \sigma) = \mathbf{x}^{\mu} + \frac{p^{\mu}l^2}{2} \cdot (\tau - \sigma) + il \sum_{n \neq 0} \frac{1}{n} \widetilde{\alpha}_n^{\mu} e^{-in(\tau - \sigma)}$$

- Manipulations of equation of motion result in wave equation
- \bullet Left and right moving weaves $X^{\mu}=1/2\left(X_{L}^{\mu}+X_{R}^{\mu}\right)$
- With Fourier expansions:

$$X_{L}^{\mu}(\tau + \sigma) = x^{\mu} + \frac{p^{\mu}l^{2}}{2} \cdot (\tau + \sigma) + il \sum_{n \neq 0} \frac{1}{n} \alpha_{n}^{\mu} e^{-in(\tau + \sigma)}$$

$$X_R^{\mu}(\tau - \sigma) = x^{\mu} + \frac{p^{\mu}l^2}{2} \cdot (\tau - \sigma) + il \sum_{n \neq 0} \frac{1}{n} \widetilde{\alpha}_n^{\mu} e^{-in(\tau - \sigma)}$$

• For the closed string, α_n^{μ} and $\widetilde{\alpha}_n^{\mu}$ are independent.

Promote Fourier modes to operators with commutation relations

$$[x^{\mu}, p_{\nu}] = i\delta^{\mu}_{\nu}$$
 $[\alpha^{\mu}_{n}, \alpha^{\nu}_{m}] = n\delta_{n+m}\eta^{\mu\nu} = [\widetilde{\alpha}^{\mu}_{n}, \widetilde{\alpha}^{\nu}_{m}]$

Promote Fourier modes to operators with commutation relations

$$[x^{\mu}, p_{\nu}] = i\delta^{\mu}_{\nu}$$
 $[\alpha^{\mu}_{n}, \alpha^{\nu}_{m}] = n\delta_{n+m}\eta^{\mu\nu} = [\widetilde{\alpha}^{\mu}_{n}, \widetilde{\alpha}^{\nu}_{m}]$

• Define vacuum $|0\rangle$ by imposing

$$\alpha_n^{\mu} |0\rangle = \widetilde{\alpha}_n^{\mu} |0\rangle = 0$$
 for all $n > 0$

Promote Fourier modes to operators with commutation relations

$$[x^{\mu}, p_{\nu}] = i\delta^{\mu}_{\nu}$$
 $[\alpha^{\mu}_{n}, \alpha^{\nu}_{m}] = n\delta_{n+m}\eta^{\mu\nu} = [\widetilde{\alpha}^{\mu}_{n}, \widetilde{\alpha}^{\nu}_{m}]$

• Define vacuum $|0\rangle$ by imposing

$$\alpha_n^{\mu} \left| 0 \right\rangle = \widetilde{\alpha}_n^{\mu} \left| 0 \right\rangle = 0 \quad \text{for all } n > 0$$

- For n>0, α_n^μ and $\widetilde{\alpha}_n^\mu$ are annihilation operators
- For n < 0, α_n^{μ} and $\widetilde{\alpha}_n^{\mu}$ are creation operators

Pretty Pictures of String Excitations

Closed Spectrum

- \bullet There is a level matching condition $N=\widetilde{N}$
- Vacuum is a tachyon, with mass $M^2 < 0$!
- \bullet First excited state is $|\pmb{\xi}\rangle=\xi_{ij}\alpha_{-1}^i\widetilde{\alpha}_{-1}^j\,|0\rangle$ with $M^2=0$
- Decompose ξ_{ij} in irreps

$$\xi_{ij} = \underbrace{\xi_{(ij)}}_{\text{symmetric}} + \underbrace{\xi_{[ij]}}_{\text{antisymmetric}} + \underbrace{\xi^{(0)}\delta_{ij}}_{\text{trace par}}$$

Closed Spectrum

• Decompose ξ_{ij} in irreps

$$\xi_{ij} = \underbrace{\xi_{(ij)}}_{\text{symmetric}} + \underbrace{\xi_{[ij]}}_{\text{antisymmetric}} + \underbrace{\xi^{(0)}\delta_{ij}}_{\text{trace part}}$$

- Symmetric part describes spin 2 gauge field ⇒ graviton!
- Antisymmetric part is called Kalb-Ramon Field.
- Trace part describes the dilaton.

Superstring

Modify the Lagrangian to include fermionic fields

$$S = S_{\mathsf{boson}} + S_{\mathsf{fermion}}$$

• By supersymmetry, fermions are related to bosons.

Superstring

Modify the Lagrangian to include fermionic fields

$$S = S_{\mathsf{boson}} + S_{\mathsf{fermion}}$$

- By supersymmetry, fermions are related to bosons.
- Supersymmetry therefore forbids a tachyonic state.

Superstring

Modify the Lagrangian to include fermionic fields

$$S = S_{\mathsf{boson}} + S_{\mathsf{fermion}}$$

- By supersymmetry, fermions are related to bosons.
- Supersymmetry therefore forbids a tachyonic state.
- For left and right moving parts, we can choose either spin 1 bosons "B"
- Or spin 1/2 fermions "F_±" with two chiralities

Decomposition into Irreps

- $(B,B) = Dilaton \oplus 2$ -Form Field $(Kalb-Ramon) \oplus Graviton$
- $(F_{\pm}, F_{\pm}) = certain k-form Fields$
- (B,F_+) = Dilatino \oplus Gravitino
- $(B,F_{-}) = Dilatino \oplus Gravitino (with different chirality)$

Type IIA/B

• Consistency conditions limit the sectors that one can choose.

Type IIA/B

- Consistency conditions limit the sectors that one can choose.
- Type IIB consists of
 - (B,B): Dilaton, Kalb-Ramon, Graviton
 - (F_+,F_+) : k-form Fields
 - (B,F₊): Dilatino, Gravitino
 - (F₊,B): Dilatino, Gravitino

Type IIA/B

- Consistency conditions limit the sectors that one can choose.
- Type IIB consists of
 - (B,B): Dilaton, Kalb-Ramon, Graviton
 - (F_+,F_+) : k-form Fields
 - (B,F₊): Dilatino, Gravitino
 - (F₊,B): Dilatino, Gravitino
- Type IIA consists of
 - (B,B): Dilaton, Kalb-Ramon, Graviton
 - (F_+,F_-) : k-form Fields
 - (B,F_): Dilatino, Gravitino (different chirality)
 - (F₊,B): Dilatino, Gravitino

Type I

- Type IIB consists of
 - (B,B): Dilaton, Kalb-Ramon, Graviton
 - (F_+,F_+) : k-form Fields
 - (B,F₊): Dilatino, Gravitino
 - (F₊,B): Dilatino, Gravitino
- Type IIB theory is invariant under exchanging left and right movers.

Type I

- Type IIB consists of
 - (B,B): Dilaton, Kalb-Ramon, Graviton
 - (F_+,F_+) : k-form Fields
 - (B,F₊): Dilatino, Gravitino
 - (F₊,B): Dilatino, Gravitino
- Type IIB theory is invariant under exchanging left and right movers.
- We call this symmetry Ω , then *closed spectrum* of type I theory is IIB/ Ω i.e. it consists of
 - Dilaton, Graviton
 - Some of the k-form fields
 - Dilatino, Gravitino
- The closed spectrum of type I theory is inconsistent by itself
- ullet Add open strings with gauge group SO(32) to complete type I theory.
- Type I theory is in some sense "half" of Type IIB theory.

Heterotic Strings

- There are yet another consistent theories, which takes bosonic strings on left moving and supersymmetric strings on right moving sector.
- Bosonic part is compactified
- This gives two new theories with gauge groups SO(32) and $E_8 \times E_8$

Bibliography

Weigand, Timo Introduction to String Theory, Lecture Notes

Ramon and Neveu-Schwarz Sectors

• If $\psi_{L,R}(\sigma)=+\psi_{L,R}(\sigma+2\pi)$ then ψ is in Ramon sector with integer Fourier expansion

$$\psi_R^\mu = \sum_{n \in \mathbb{Z}} b_n^\mu e^{-in(\tau - \sigma)} \qquad \psi_L^\mu = \sum_{n \in \mathbb{Z}} \widetilde{b}_n^\mu e^{-in(\tau + \sigma)}$$

• If $\psi_{L,R}(\sigma)=-\psi_{L,R}(\sigma+2\pi)$ then ψ is in Neveu-Schwarz sector with half integer Fourier expansion

$$\psi_R^\mu = \sum_{r \in \mathbb{Z} + \frac{1}{2}} b_r^\mu e^{-ir(\tau - \sigma)} \qquad \psi_L^\mu = \sum_{r \in \mathbb{Z} + \frac{1}{2}} \widetilde{b}_r^\mu e^{-ir(\tau + \sigma)}$$

 \bullet So there are total of 4 choices possible: (NS,NS) (NS,R) (R,NS) (R,R)

Promote Fourier modes to operators with anti-commutation relations

$$\{b_n^\mu,b_m^\nu\}=\eta^{\mu\nu}\delta_{n+m}=\{\widetilde{b}_n^\mu,\widetilde{b}_m^\nu\}$$

Define Vacua:

$$\alpha_n^{\mu} |0\rangle_{NS} = b_r^{\mu} |0\rangle_{NS} = \widetilde{b}_r^{\mu} |0\rangle_{NS} = 0 \quad \forall n, r > 0$$

$$\alpha_{n}^{\mu}\left|0\right\rangle_{R}=b_{m}^{\mu}\left|0\right\rangle_{R}=\widetilde{b}_{m}^{\mu}\left|0\right\rangle_{NS}=0 \quad \forall n,m>0$$

Improtant: NS ground state is well defined and is a space-time scalar.
 However, R ground state is degenerate as

$$b_m^{\mu} b_0^{\nu} |0\rangle_R = -b_0^{\nu} b_m^{\mu} |0\rangle_R = 0$$

 \bullet Because of this degeneracy, one can show that $|0\rangle_R$ is a fermion.

Massless Spectrum

• Recall that $|0\rangle_R$ is a fermion and $|0\rangle_{NS}$ is a scalar.

Sector (L,R)	State	SO(8) rep
(NS,NS)	$\left \begin{array}{c} b_{-1/2}^{i} \left 0 \right\rangle_{NS} \otimes \widetilde{b}_{-1/2}^{i} \left 0 \right\rangle_{NS} \end{array} \right $	$8_v \otimes 8_v$

Massless Spectrum

• Recall that $|0\rangle_R$ is a fermion and $|0\rangle_{NS}$ is a scalar.

Sector (L,R)	State	SO(8) rep
(NS,NS)	$ b_{-1/2}^{i} \ket{0}_{NS} \otimes \widetilde{b}_{-1/2}^{i} \ket{0}_{NS} $	$8_v \otimes 8_v$
(R_+,R_+)	$ +\rangle_R\otimes +\rangle_R$	$8_s \otimes 8_s$
(R_+,R)	$ +\rangle_R\otimes -\rangle_R$	$8_s \otimes 8_c$
(R,R)	$\ket{-}_R \otimes \ket{-}_R$	$8_c \otimes 8_c$

Massless Spectrum

• Recall that $|0\rangle_R$ is a fermion and $|0\rangle_{NS}$ is a scalar.

Sector (L,R)	State	SO(8) rep
(NS,NS)	$\left \begin{array}{c} b_{-1/2}^{i} \left 0 \right\rangle_{NS} \otimes \widetilde{b}_{-1/2}^{i} \left 0 \right\rangle_{NS} \end{array} \right $	$8_v \otimes 8_v$
(R_+,R_+)	$\ket{+}_R \otimes \ket{+}_R$	$8_s \otimes 8_s$
(R_+,R)	$ +\rangle_R\otimes -\rangle_R$	$8_s \otimes 8_c$
(R,R)	$ - angle_R\otimes - angle_R$	$8_c \otimes 8_c$
(NS,R_+)	$b_{-1/2}^{i}\left 0 ight angle _{NS}\otimes\left + ight angle _{R}$	$8_v \otimes 8_s$
(NS,R)	$b_{-1/2}^{i}\ket{0}_{NS}\otimes\ket{-}_{R}$	$8_v \otimes 8_c$
